Nordik Roe - Roebuck call.

This call is developed specially for calling Roebuck. It is pre-tuned for all the sounds you need, simply move the rubber band between the two outermost notches on the call to change sound. This call has a double sound board that can be used to control the volume. If you want a softer sound, cover the large hole on the underside of the call with your thumb.

Alternate contact / agitation / agony sounds with some minute between for 20-30 minutes / stand. You find calling schedule and more tips in the DVD - Calling Roebucks

The doe agony sound: Place the rubber band in the second notch whilst biting over the first notch with your teeth and holding your lips on the rubber band. Begin by making an agitation sound and then let go of the teeth grip on the membrane and you will have an agony sound.

Volume control:
To lower the sound, hold the thumb over this hole.

The contact and agitation sounds of the doe: Place the rubber band in the first notch, blow short thrusts of air for the contact sound and longer for the agitation sound. To make the contact and agitation sound of the fawn you need to bite hard on the rubber band and blow the call the same way as for the doe sounds.
